

Re-doing Lab 3

:)

27 April, 2023 14:52:01

Complete the following exercises before the submission deadline. In addition to the points detailed below, 5 points are assigned to the quality of the annotation, as well as to the ‘cleanliness’ of the code and resulting pdf document.

Exercise 1 – 1 point

We will again be working with the BC Parks dataset, which contains information on the locations of Provincial Parks in British Columbia. The parks belong to 5 different regions. There is also information on elevation (in m) and percent forest cover contained within the dataset.

- Import the BC park locations dataset and convert the data to a **ppp** object (for today you can exclude information on regions). – 1 point(s)

Note: You will need to load the **maptools** package and make use of the **as.owin()** function.

```
# 1
#quiet function
quiet <- function(x) {
  sink(tempfile())
  on.exit(sink())
  invisible(force(x))
}

#importing dataset
lc = read.csv("../datasets/processed/lc.csv")

#importing window
suppressMessages(library(spatstat))
suppressMessages(library(sf))
suppressMessages(library(maptools))
load("../datasets/raw/BC_Covariates.Rda")
bc_window_sf = st_as_sf(DATA$Window)
bc_window_owin = as.owin(bc_window_sf)

#converting to a ppp
lc_ppp = ppp(x = lc$decimalLongitude,
             y = lc$decimalLatitude,
             window = bc_window_owin,
             )
```

```
## Warning: 2 points were rejected as lying outside the specified window
```

```
## Warning: data contain duplicated points
```

```
plot(lc_ppp, pch = 16, cols = "#046C9A", cex = 0.6)
```

```
## Warning in plot.ppp(lc_ppp, pch = 16, cols = "#046C9A", cex = 0.6): 2 illegal
## points also plotted
```

lc_ppp

Exercise 2 – 4 points

- Estimate and plot ρ for the locations of parks as a function of both elevation and forest cover (be sure that the x-axis for elevation does not go below 0). – 2 point(s)
- Check for collinearity between elevation and forest cover (you will need to consider NA values). – 1 point(s)
- Based on these initial analyses, write down the expected form of the model. Provide justification for this starting point. – 1 point(s)

Note: Estimating rho can be slow (~ 1 -2 min). Be sure to leave enough time for the document to knit.

```
# 1
elev = DATA$Elevation
rho_elev = rhohat(lc_ppp, elev)
forest = DATA$Forest
rho_forest = rhohat(lc_ppp, forest)
par(mfrow = c(1,2))
plot(rho_elev,
     main = "",
     xlab = "Elevation (m)",
     xlim=c(0, 3600))
plot(rho_forest,
```

```
main = "",
xlab = "Forest Cover (%)")
```

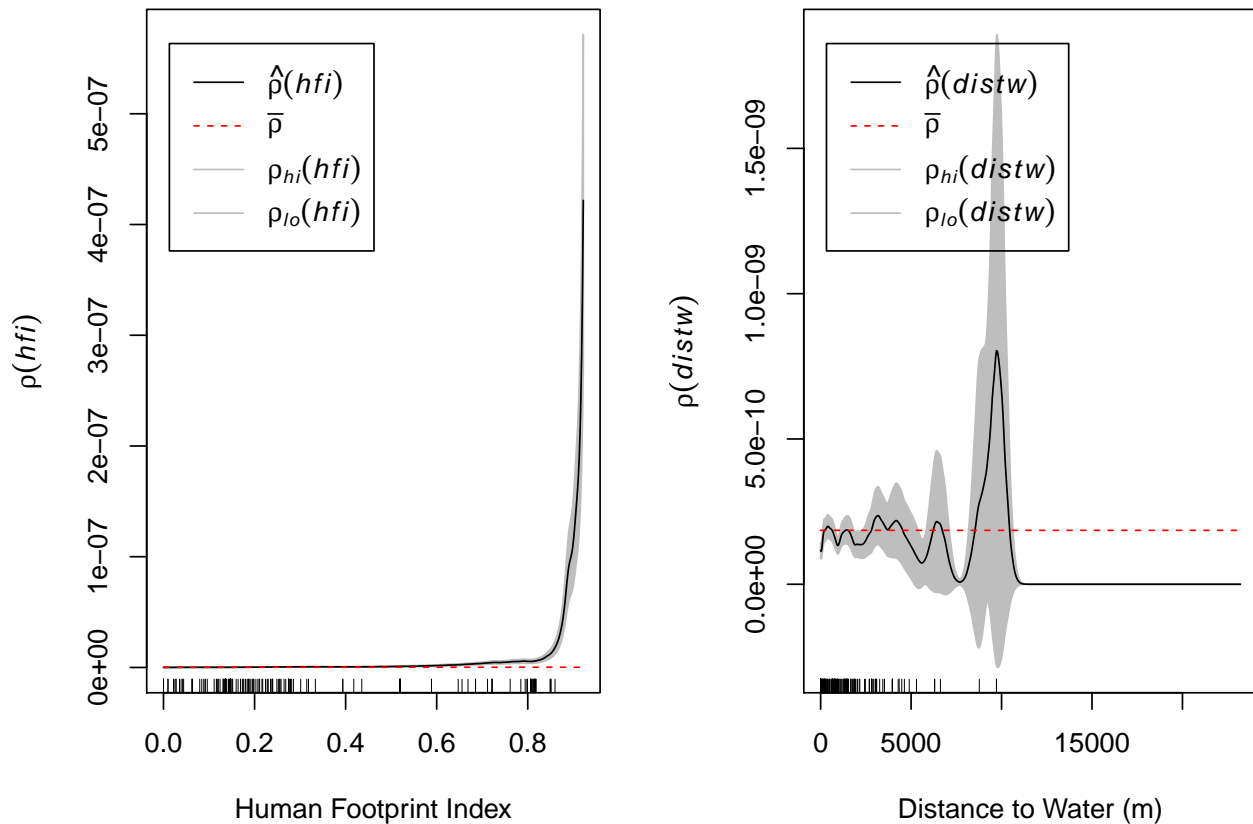

```
par(mfrow = c(1,1))
```

HFI is based on: population density, land transformation, human access, and power infrastructure.

```
# 1
hfi = DATA$HFI
rho_hfi = rhohat(lc_ppp, hfi)
```

```
## Warning: Values for 1 query point lying outside the pixel image domain were
## estimated by projection to the nearest pixel
```

```
distw = DATA$Dist_Water
rho_distw = rhohat(lc_ppp, distw)
par(mfrow = c(1,2))
plot(rho_hfi,
     main = "",
     xlab = "Human Footprint Index")
plot(rho_distw,
     main = "",
     xlab = "Distance to Water (m)")
```

```
par(mfrow = c(1,1))

#correlation
cor.im(elev, forest, hfi, distw, use = 'complete.obs')
```

```
##          ..1          ..2          ..3          ..4
## ..1  1.00000000 -0.26225376 -0.26625626 -0.03493453
## ..2 -0.26225376  1.00000000  0.06618592  0.04818598
## ..3 -0.26625626  0.06618592  1.00000000  0.13246899
## ..4 -0.03493453  0.04818598  0.13246899  1.00000000
```

Exercise 3 – 4 points

- Fit the model you have defined in exercise 2 and inspect the model output. – 1 point(s)
- Fit a null, intercept only model. – 1 point(s)
- Use AIC and a likelihood ratio test to determine if the model you defined is a better fit than the intercept only model. – 1 point(s)
- Write down the equation for the selected model. – 0.5 point(s)
- Use this equation to estimate the intensity of parks at 500m elevation and 50% forest cover.

```
# 0
#mean centering and scaling the elevation and distance to water variables
mu <- mean(DATA$Elevation)
stdev <- sd(DATA$Elevation)
Elevation_scaled <- eval.im((elev - mu)/stdev, DATA)
mu <- mean(DATA$Dist_Water)
stdev <- sd(DATA$Dist_Water)
Dist_Water_scaled <- eval.im((distw - mu)/stdev, DATA)
```

```

Lynx GAM

Exercise 4 – 4 points

- Visualise the fitted model. Note: log scale the estimated intensity when plotting, ignore the standard error. You can use the `n` argument to adjust the resolution – 1 point(s)
- Plot the effects of the individual coefficients. Note: use the median value(s) of the other coefficients. – 2 point(s)
- Visually, do you think the model predictions are a good match to the data? – 1 point(s)

#See above

Exercise 5 – 1 point

- Test whether the observed data deviate significantly from the model predictions. – 1 point(s)

```
# 1
library(splines)
quadrat.test(fit2, nx = 2, ny = 4)

##
## Chi-squared test of fitted Poisson model 'fit2' using quadrat counts
##
## data: data from fit2
## X2 = 56.478, df = 3, p-value = 6.641e-12
## alternative hypothesis: two.sided
##
## Quadrats: 8 tiles (irregular windows)
```

```

Model Validation

Intensity of a fitted point process model as a function of one of its covariates

```
## For PPM fit
#Elevational effect on lambda at mean hfi
elev_effect = effectfun(fit2, "Elevation_scaled", hfi = mean(hfi), se.fit = T)

#HFI effect on lambda at mean elevation
hfi_effect = effectfun(fit2, "hfi", Elevation_scaled = mean(Elevation_scaled), se.fit = T)

#Side by side plotting
par(mfrow = c(1,2))
#Plot the elevation effect
plot(elev_effect,
     legend = FALSE,
     main = "Elevational effect at mean HFI")

#Plot the slope effect
plot(hfi_effect,
     legend = FALSE,
     main = "Effect of HFI at mean elevation")
```

Elevational effect at mean HFI

Effect of HFI at mean elevation

```
par(mfrow = c(1,1))
```

Relative Intensity

```
#Calculate the relative intensity as a function of elevation
rh_elev = rhohat(na.omit(fit2), na.omit(Elevation_scaled))

#Calculate the relative intensity as a function of hfi
rh_hfi = rhohat(na.omit(fit2), na.omit(hfi))
